

# AK VisionFlow Owner Android App

## Phase 2 — Executive Dashboard & Business Statistics

Phase 2 turns the secure Android foundation into a practical owner dashboard. The owner can see the current health and performance of the business, but still cannot perform operational entries or changes.

### 1. Phase Objective

Create a fast, mobile-first executive dashboard that answers three questions: **How is the business performing? What changed? Where should the owner look?** All figures come from the central VisionFlow backend/business intelligence layer.

### 2. Dashboard KPI Cards

| KPI Group             | Information                                                             |
|-----------------------|-------------------------------------------------------------------------|
| Sales                 | Today, yesterday, week, month, custom period; growth/decline percentage |
| Profit                | Gross profit, net profit, gross margin, net margin                      |
| Expenses              | Today/month expenses and comparison with previous period                |
| Receivables           | Total outstanding, overdue amount, recent collections                   |
| Orders / Transactions | Transaction count, average transaction value                            |
| Inventory             | Inventory value, low-stock count, out-of-stock count                    |

### 3. Sales Analytics

The dashboard will provide compact visual trends for sales performance, including daily/weekly/monthly sales, period-over-period comparison, sales by branch, category, product and payment method, plus transaction count and average transaction value.

### 4. Profit Analytics

Show gross sales, discounts, cost of goods, gross profit, gross margin, expenses, net profit and net margin. The owner should be able to identify whether revenue growth is translating into actual profit.

### 5. Business Filters

- **Date:** Today, Yesterday, This Week, This Month, Custom Range.
- **Branch:** All Branches or a specific branch.
- **Business Area:** Relevant VisionFlow business area/category.
- **Category/Product:** Drill into selected categories or products where applicable.

Filters must be centralized and easy to use. The same selected period/branch context should be preserved when moving between compatible dashboard views.

### 6. Inventory Visibility

Phase 2 provides visibility only: low-stock products, out-of-stock products, inventory value, fast/slow-moving indicators where available, and basic stock movement. No stock adjustment or inventory editing is allowed.

## 7. Receivables Visibility

Display total outstanding, overdue amount, collections trend, and customers/accounts with significant outstanding balances. Where data supports it, show aging buckets such as 0–30, 31–60, 61–90 and 90+ days.

## 8. Dashboard UX

- Mobile-first cards with clear numbers and concise labels.
- Charts must remain readable on small screens.
- Use progressive disclosure: summary first, details after tapping a KPI.
- Loading, empty-state and API-error states must be handled cleanly.
- Avoid duplicating large web reports; show only owner-relevant information.
- Dashboard should load quickly using API responses optimized for mobile.

## 9. Read-Only Enforcement

Phase 2 continues the Phase 1 security model. Dashboard screens are strictly read-only. There must be no create, edit, delete, stock adjustment, payment posting, invoice generation, POS or settings operation from Android.

Backend authorization remains the final security boundary.

## 10. Recommended API Structure

| API                | Purpose                                        |
|--------------------|------------------------------------------------|
| /owner/dashboard   | Summary KPIs for the selected period/context   |
| /owner/sales       | Sales trends and breakdowns                    |
| /owner/profit      | Profit and margin metrics                      |
| /owner/expenses    | Expense summaries                              |
| /owner/receivables | Outstanding and aging information              |
| /owner/inventory   | Inventory visibility and stock alerts data     |
| /owner/filters     | Available branches/categories/business filters |

## 11. Phase 2 Completion Criteria

1. Owner can view the main business KPIs on Android.
2. Sales and profit trends are visible for selectable periods.
3. Owner can filter compatible dashboard information by date and branch.
4. Receivables and inventory warning information is visible.
5. Period comparisons and growth/decline indicators are calculated consistently with the web system.
6. Dashboard data is served by the central VisionFlow backend and not recalculated independently by Android.
7. Read-only restrictions remain enforced at API level.
8. Dashboard is responsive, fast and usable on typical Android phones.
9. Phase 3 can consume the same KPI/alert data for push notifications.

## 12. Phase 2 Result

**Result:** A fully usable read-only Executive Owner Dashboard on Android. The owner can open the app, immediately understand sales/profit/financial/inventory performance, apply key filters, and drill into important statistics—without being able to change the business data.

**Next Phase:** Phase 3 — Business Alerts + Push Notifications.
